

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

**Tringa bairdii on Long Island Sound.**—A female *Tringa bairdii* was shot at Stratford, Connecticut, November 3, 1888, by Mr. J. H. Averill of Bridgeport, who kindly presented it to me. It was on a salt meadow in company with four *Tringa maculata*. Having no specimens for comparison I sent the skin to Dr. C. H. Merriam, Dept. of Agriculture, who identified it as above.—C. K. AVERILL, JR., *Bridgeport, Connecticut*.

**Note on the First Plumage of *Colinus ridgwayi*.**—Mr. Herbert Brown of Tucson, Arizona, has kindly sent me for examination a specimen of *Colinus ridgwayi*, a young male, still partly in the first plumage. It was taken Oct. 10, 1888, near Tubal, seventy miles south of Tucson. The top of the head is blackish, with each feather narrowly bordered with ashy brown. The hind neck, sides of the neck, and jugulum are yellowish white, with each feather barred at the tip with black. The scapulars are brownish, each feather with a rather broad whitish shaft stripe, and barred with yellowish white and black, and the wing coverts have much the same pattern, but the barring is pale cinnamon and brown. The throat is pure white, with new black feathers appearing irregularly along the sides of the chin and upper throat. Breast pale brown, with light shaft stripes and faintly barred with blackish, passing into brownish white with more distinct bars on the upper abdomen. The new feathers along the sides of the breast and flanks are chestnut, tipped with a spot of clear white, which is bordered behind with a more or less V-shaped bar of deep black. The broad yellowish white superciliary stripes extend to the nostrils. On the whole the first plumage of *C. ridgwayi* much resembles that of *C. virginianus texensis*, but the ground color above is darker, and the bars on the jugulum are stronger and better defined, and the ground color more whitish.—J. A. ALLEN, *Am. Mus. Nat. Hist., New York City*.

**Another Saw-whet Owl (*Nyctala acadica*) in the District of Columbia.**—Mr. J. D. Figgins shot a male Saw-whet Owl at Capitol View Park, a short distance from Washington, on March 12, 1889. When discovered it was feeding on a Junco, and was surrounded by an angry lot of small birds.

Three other specimens of this species have been taken here, as follows: A female was taken at Washington by C. Drexler, Feb. 12, 1859, and presented to the National Museum (No. 12,044). Dr. Fisher called my attention to a description of this specimen in 'History of North American Birds,' Vol. III, p. 43. The Museum number was given as 120,044 but was a misprint for 12,044. A female Saw-whet Owl was captured in this city on November 1, 1878, and presented to the National Museum (No. 97,987) by Mr. Henry Marshall. Another was taken early in October, 1886, and recorded in 'The Auk,' Vol. IV, p. 161, by Mr. F. S. Webster.—CHARLES W. RICHMOND, *Washington, D. C.*

**A Fishing Screech Owl.**—I secured a Screech Owl Feb. 2, 1889, which
